

Five briefing outlines

Five investment-banking model builds. Each one is what a senior banker needs to cover when handing the work to an analyst — the points to make, not the words to say. The wording is yours; the specifics that can't be invented (given figures, tab names, stated ranges) are listed because they have to be transferred exactly.

Each outline is tested against the real workbooks: the input and output files are compared cell by cell, and anything the analyst couldn't have derived on their own has to appear here. See [tests/README.md](#).

#	Task	Input	Output	Cell changes	Enforced
1	2266fdca	GD006_N-4.xlsx	GD006_N-3.xlsx	816	45
2	b68326d5	FIMR_N-1.xlsx	FIMR.xlsx	329	57
3	bb849b91	7.27_013_N-2.xlsx	OUTPUT_WORKBOOK_-_TIBA.xlsx	2,310	2
4	ef94a62b	7.20_016_N-2.xlsx	7.20_016_N-1.xlsx	27,450	52
5	fbe4760b	Model_v4_N-2.xlsx	Model_v4_N-1__v2_.xlsx	1,198	24

1 — Operating model off the assumptions sheet

Situation. Sell-side process for a sponsor-owned distributor. The quality-of-earnings report has just come back, and the full operating model is due in the data room Monday. The workbook currently contains only the Assumptions sheet — the rest was stripped out in a rebuild and never replaced.

Input: GD006_N-4.xlsx · **Output:** GD006_N-3.xlsx

What to ask for

- Four new tabs built off the Assumptions sheet, covering FY2022A through FY2030P: **Enterprise P&L**, **Working Capital**, **Debt Schedule**, and an **EBITDA Bridge** from FY2024A to FY2025B.
- Everything links — to the Assumptions sheet and to each other.
- Match the model's existing structure, units and formatting conventions.

Enterprise P&L

- Run it through net income.
- Operating assumptions link to the Assumptions sheet; debt interest links to the Debt Schedule.
- Include D&A, operating income (EBIT), the QoE adjustments, adjusted EBITDA, interest expense, other income and expense, tax expense, net income, and margins.
- **Non-operating other income is given, so it has to be read out** — FY2022A through FY2030P in order: 4.8, 4.8, 4.7, 4.4, 3.9, 4.2, 4.3, 4.5, 4.7.
- Tax applies only to positive pre-tax income, at the consolidated effective rate held on the Assumptions sheet (link it rather than retyping it).

Working capital

- 365-day basis.
- The day counts have to be given:

	FY2022A	FY2023A	FY2024A	FY2025B onward
DSO	42.7	42.5	42.5	42.0

	FY2022A	FY2023A	FY2024A	FY2025B onward
DIH	60.0	52.0	49.0	48.0
DPO	105.0	94.0	110.0	105.0

- Worth flagging: the FY2024A DPO spike is real — that's the year they stretched payables — so it shouldn't be smoothed.
- Prepays 0.0% of operating expenses; accrued liabilities 10.0% of operating expenses; deferred revenue 0.0% of revenue.

Debt schedule

- Two tranches. Interest calculated on the **average of beginning and ending balances**, not the opening balance — worth saying explicitly.
- **Term loan:** opens at 3.5 in FY2022A, repays 0.5 a year from FY2022A until fully repaid. Rate is 0.0% in FY2022A and FY2023A — worth confirming that is genuinely zero, not a missing input — then 10.0% from FY2024A while a balance is outstanding.
- **Line of credit:** opens at 1.5 in FY2022A. Repayments of 0.5 in FY2023A, 0.5 in FY2024A, 0.3 in FY2025B. No further draws or repayments, leaving 0.2 outstanding through FY2030P. 10.0% throughout.

EBITDA bridge

- A formula-driven walk from FY2024A EBITDA to FY2025B EBITDA. Worth stressing that it's formula-driven — this is the page the sponsor turns to first.
- Separate variance steps for: Segment Alpha revenue, Segment Beta revenue, Segment Gamma revenue, all other revenue lines combined as "**Other Revenue Lines**", COGS, Customer Acquisition, Postal Charges, Staff Costs, SG&A, Other OpEx.
- Columns: component, period-over-period **value** change, running cumulative EBITDA, component type.
- A chart helper block underneath — **Base, Increase, Decrease, Total** — formula-driven and ready to plot as a waterfall.
- A short **summary** block on the FY2024A-to-FY2025B walk: starting EBITDA, total change, ending EBITDA.

Ground rules to close on

- Keep the model's color convention: typed inputs, formulas, and cross-sheet links each in their existing color.
- The schedules tie out before it comes back.

2 – Cedarbrook Social IPO analysis

Situation. Cedarbrook Social is going public. The pricing analysis is needed for the IPO committee memo, and committee won't accept a single point estimate — everything needs a range around it. The shell is already in the workbook.

Input: FIMR_N-1.xlsx · **Output:** FIMR.xlsx

Set-up

- Fees and commissions rate: **1.1%**, used throughout.
- In the option holder table: net shares on the **treasury stock method**, then total every column.
- From the balance sheet through proforma ownership, every section gets **pre-money / IPO / post-money** columns. Valuation is the exception — pre and post only, no IPO column.

Sources and uses of funds

- Shown in both **\$m and shares**.
- Source of funds is the equity issued. Uses of funds are: primary shares (proceeds raised net of fees), primary shares underwriting fees, secondary shares (proceeds raised net of fees), secondary shares underwriting fees.
- Include a **check total row**.

Balance sheet (simplified)

All pre-money figures have to be given:

Cash and cash equivalents	1,282
Short-term investments	2,628
Goodwill	189
Operating assets	receivables 482, inventory 627, prepaid expenses 1,855, other 121
Debt / capital leases	404 / 302
Operating liabilities	payables 1,039, accrued expenses 144, less 302 deferred tax asset offsets
Equity	5,597

- The IPO column is net primary proceeds into cash and equity; post-money is the two added.
- Show total assets, and total liabilities and equity.

Income statement (simplified)

- Return on cash invested 0%; tax rate 40%.
- D&A 323; EBIT 1,756; pre-money net interest income –42 – 19; pre-money tax –695; net income attributable to participating securities –332 (same pre and post); pre-money EPS 0.4.
- The IPO column adds return on the new cash at the assumed rate, plus its tax effect.
- Derive PBT, net income, **net income attributable to Class A and Class B common stockholders**, WASO and EPS, and include an **EPS accretion / dilution** line.

Valuation, and ownership

- Valuation (pre / post): diluted NoSO, offer price — **hardcode 38** in the post-money column — implied equity value, net debt, implied enterprise value, pre-deal P/E, post-deal P/E, EV/EBITDA.

- Proforma ownership (all three columns): pre-deal shareholders including option holders, new shareholders, total shares, post-money ownership percentages.

The four sensitivity grids

Each range has to be stated in full — the ends and the increment:

- **Analysis at various prices** — \$34.00 to \$42.00 in \$2.00 increments, showing pre-deal P/E, post-deal P/E and EV/EBITDA, driven off the valuation section.
- **Shareholder dilution at different issuance of shares** — primary 160 to 200 in increments of 10, secondary 211.2 to 281.2 in steps of 10, run against the pre-deal ownership percentage.
- **New money raised** — offer price \$34.00 to \$42.00 by \$2.00 across, primary shares 160 to 200 by 10 down.
- **Proceeds to existing shareholders** — same price range across, secondary shares 211.2 to 281.2 by 10 down.

Ground rules to close on

- Hardcodes in **#0000FF**, calculated values in black, **Arial 10pt**.
- Number formats and header fills consistent with the surrounding model — it gets screenshotted into the memo.

3 – Annual cashflows, four entities

Situation. A financing on a four-entity Egyptian real estate portfolio. The lender's credit team won't work off the monthly tabs and has asked for annual cashflow statements. The annual tabs already exist with the correct row structure and section labels — only the numbers are missing, and they come from aggregating the monthly data.

Input: 7.27_013_N-2.xlsx · **Output:** OUTPUT_WORKBOOK_-_TIBA.xlsx

What to ask for

- Annual cashflow statements for all four entities — **TIBA, Stone Park, Sahary and El-Rowad** — each on its own **CF - Annually** tab.
- Annual columns built by summing the monthly data in **eleven successive 12-month blocks starting October 2020**, which covers the full 132-month grid end to end.
- Starting Balance, Total and Grand Total columns completed consistently with the existing layout.
- Row and section labels kept matching the monthly tabs — worth explaining why: credit will read the two side by side.
- All subtotal, total and net cashflow rows completed with the workbook's standard section logic, across every column type.

The difference between the entities

This is the part that needs saying explicitly, because the four tabs are not identical:

- **TIBA and Stone Park** have a cashflow from finance section — facility drawdown, facility repayment, interest expense, other fees — sourced from their monthly tabs. For these two, periodical net cashflows = net cash inflows/outflows **plus** net cashflows from finance.
- **Sahary and El-Rowad** have no finance section. For these two, periodical net cashflows = net cash inflows/outflows directly.

Cash balance

- Complete the cash balance roll-forward on each tab.
- Populate the **Minimum Cash END Balance** field at the top of each tab — worth noting this is the covenant conversation.

Client hardcodes — these can only come from you

- On **Sahary**: enter **0** for the Dues To Sister Companies line in the 2025 and 2026 annual columns.
- On **TIBA and Sahary**: park a **60,000,000** memo figure in cell **AU40** — outside the reporting columns, and it shouldn't feed anything.

Ground rules to close on

- Colors follow the monthly tabs: blue for typed hardcodes, **#008000** for links to other tabs, black for same-sheet calculations.

4 – SBA acquisition model and loan tabs

Situation. A real estate acquisition funded with SBA 504 and SBA 7(a) financing, plus a refinance in year 5. The sponsor wants to know whether the LP gets paid, which can't be answered until the debt is modelled.

Input: 7.20_016_N-2.xlsx · **Output:** 7.20_016_N-1.xlsx

Assumptions tab

- Add a **year-number header row, 1 through 10**, above the Gross Revenue row, as the period index for the revenue/expense table.
- Add formulas for **Total Expenses** (salaries/wages plus other expenses), **OPEX Expense Ratio** (total expenses / gross revenue), and **NOI**.
- NOI must respect the "**Use Manual?**" switch: if yes, gross revenue × (1 – manual expense ratio); if no, gross revenue less actual total expenses.
- Loan sizing:
 - SBA 504 loan amount = SBA 504 % × RE Budget Total.
 - SBA 7(a) loan amount = SBA 7(a) % × Basis for 7a Loan Calc, where that basis = Total Funds – RE Budget Total.
- REFI: **LTV Value** looks up NOI at the Refi Period year (using the year header row as the index) ÷ Cap Rate on Refi; **REFI Amount** = LTV × LTV Value. Worth explaining why it must be a lookup: the refi year will change.

Sources and uses, and returns

- **Sources:** SBA 504 loan, SBA 7(a) loan, raised funds, total — pulled from the computed loan amounts and Required Raise.
- **Uses:** real estate purchase price, business purchase price, acquisition fee, gap funding, loan fees, legal, cash reserve, total. Loan fees and legal are label-only for now (no values yet); cash reserve is the residual so sources total equals uses total.
- **Returns block** below the deal terms: IRR and equity multiple for both LP and GP, plus a **Remaining LP Balance After REFI** label row (value linked later).

Three new tabs

- **L1** = SBA 504 amortization, **L2** = SBA 7(a), **L3** = REFI. All on the General Loan Amortization layout; L3 additionally labelled **REFI** at the top.
- Parameter block at the top of each, pulling from the relevant Assumptions section: loan amount, start month of repayment, I/O period in months (Assumptions years × 12), end loan after I/O?, recast loan?, I/O rate, amortization period in years, term of loan in years, interest rate, payoff early?, start date, end date, and totals for **total interest** and **total principal repaid**.
- **Start month of repayment is hardcoded 1 on L1 and L2**; on L3 it's derived from the REFI section (refi period converted to a month number).

The monthly schedules

- **400 rows** on each tab. Monthly interest = annual rate ÷ 12. Use **ROUNDUP** when converting remaining amortization years to months.
- Columns, in order — this list has to be given: year #, date, model month #, borrow amount, beginning balance, principal, balloon payment, exit repayment, extra principal, interest, interest rate, ending balance, repayment counter, amortization counter, offset (when extra principal happens), total principal, total debt payment, amortization payment (not recast), other reduction to principal, total principal, total interest, amortization only.
- **L1 differs:** two additional period-tracking columns before Date, and "Original Loan Month #" in place of "Model Month #".

- On **L1 and L2**: hardcode **0** in the extra principal input cells for the last four rows, months **397–400**.

Ground rules to close on

- Hardcoded inputs **#0000FF**, same-sheet formulas black, cross-sheet links **#008000**.
- **Aptos Narrow 11** throughout the new sections; number formats and header fills consistent with the rest of the workbook.

5 — Cedarbrook AUM and revenue forecast

Situation. Diligence on Cedarbrook, an asset manager. Management's forecast runs a single blended fee rate across every product, which won't survive diligence — open-ended funds and institutional accounts don't earn the same basis points. The fee rate needs building up from actual history, and the forecast driven off that.

Input: Model_v4_N-2.xlsx · **Output:** Model_v4_N-1_v2_.xlsx

AUM_Rollforward — extend it

- Section **(IV) Institutional Accounts** is missing its **Key Memo Item** block after the ending balance. Add it: four rows off that section's own rollforward — inflows % of BoP, outflows % of BoP, market performance % of BoP, other % of BoP.
- Add a **(V) Total** section aggregating all four product categories, with the same structure as the individual sections (beginning balance, inflows, outflows, net flows, market performance, other, ending balance), followed by the same four-metric Key Memo Item block.

Revenue_Build — new tab

- A fee analysis schedule with a **"Fiscal Year Ended,"** date header covering the available fiscal year history.
- One section, **"(I) Fees by Avg AUM"**, with four sub-sections: (a) Open-Ended Funds, (b) Closed-End Funds, (c) Retail Separate Accounts, (d) Institutional Accounts.
- Three rows each: **Fees** (investment management fees from Revenue_Breakdown, in \$'000s), **Avg AUM** (average of beginning and ending balances from AUM_Rollforward, in \$mm), and **Avg Fees %** (the derived rate).
- Only populate columns where **both** beginning and ending AUM are available — worth explaining: a half-year denominator flatters the fee rate.

Revenue_Forecast — new tab

- Same **"Fiscal Year Ended,"** header, plus a unit note reading **"(AUM in \$mm, Revenue in \$'000s)"**.
- Four product sections mirroring the rollforward categories: (I) Open-End Funds, (II) Closed-End Funds, (III) Retail Separate Accounts, (IV) Institutional Accounts.
- Each section contains:
 - an AUM rollforward — BoP AUM, net flows, market performance, other, EoP AUM;
 - a driver memo block labelled *[Product]* **AUM Drivers:** — net flows % of BoP, market performance % of BoP, other % of BoP;
 - an **Avg Fees** row;
 - a revenue line labelled *[Product]* **Revenue Inv. Mgmt Fees**, driven by period average AUM × avg fees %.
- **Historicals:** AUM from AUM_Rollforward, Avg Fees linked from Revenue_Build, driver percentages computed off the rollforward. **FY2022–FY2024** historical, **FY2025–FY2029** forecast.
- **Forecast:** drive AUM movements off BoP using a **rolling three-year trailing average** of each driver percentage — the window rolls forward and picks up prior forecast years, rather than freezing on the last three actuals. Carry Avg Fees forward on the same rolling basis.

Ground rules to close on

- Calculated values in black, **Aptos Narrow 11** in the changed sections.
- Number formats and section header fills consistent with the existing workbook.
