

Five monologues

Training data. Each of the five tasks exported on 2026-09-04 (`tasksexport20260904.json`) is an input workbook, a build specification and an output workbook. Below, each specification is spoken — one senior banker briefing an analyst on the work, start to finish, uninterrupted.

No staging, no character names, no back-and-forth. Just what gets said.

Every figure, rate, day count, range, font and color rule from the original specification is in the speech. The output workbook only ties out if they all survive, so none of them were dropped or rounded off.

#	Task id	Input workbook	The build
1	2266fdca	GD006_N-4.xlsx	P&L, working capital, debt schedule, EBITDA bridge
2	b68326d5	FIMR_N-1.xlsx	IPO sources & uses, pro forma balance sheet, valuation, dilution grids
3	bb849b91	7.27_013_N-2.xlsx	Annual cashflow statements, four entities
4	ef94a62b	7.20_016_N-2.xlsx	SBA sources & uses, returns, three amortization tabs
5	fbe4760b	Model_v4_N-2.xlsx	AUM rollforward, fee build, five-year revenue forecast

1 — Operating model off the assumptions sheet

2266fdca · in GD006_N-4.xlsx · out GD006_N-3.xlsx

The QoE came back this afternoon and management wants the full operating model in the data room Monday, so this is tonight and probably tomorrow.

What you've got is the Assumptions sheet. That's it — everything downstream got stripped when we rebuilt the file, so you're building it back. Four tabs off that sheet, FY2022A through FY2030P, every one of them running the full nine years. Enterprise P&L, Working Capital, Debt Schedule, and an EBITDA bridge from FY2024A to FY2025B.

Use the structure that's already in the book. Same units, same formatting conventions. Don't reinvent the house style in the middle of a live process — whatever the Assumptions sheet does, you do.

Start with the P&L, because everything else hangs off it. Run it through Net Income. Operating assumptions link back to the Assumptions sheet. Debt interest links forward to the Debt Schedule — build the shell, point at it, it'll fill in when you get there.

Lines you need, in order: Depreciation and Amortization, Operating Income — that's your EBIT line — then the QoE adjustments, Adjusted EBITDA, Interest Expense, Other Income and Expense, Tax Expense, Net Income. Margins alongside all the way down.

Non-operating other income is given to us, so hardcode it: 4.8, 4.8, 4.7, 4.4, 3.9, 4.2, 4.3, 4.5, 4.7. That's FY2022A through FY2030P in order, nine numbers, nine years.

Tax on positive pre-tax income only — don't tax a loss year — and use the consolidated effective rate that's sitting on the Assumptions sheet. Don't type the rate in again somewhere else, link it.

Working capital next. 365-day basis throughout.

DSO is 42.7 days in FY2022A, 42.5 in FY2023A and again in FY2024A, then 42.0 from FY2025B onward and it holds flat out to FY2030P.

DIH is 60.0 in FY2022A, 52.0 in FY2023A, 49.0 in FY2024A, then 48.0 from FY2025B onward.

DPO is 105.0 in FY2022A, 94.0 in FY2023A, 110.0 in FY2024A, then back to 105.0 from FY2025B onward. The 110 in FY2024A is real — that's the year they stretched payables. Don't smooth it, it's part of the story we're telling on cash.

Prepays are 0.0% of operating expenses. Accrued liabilities, 10.0% of operating expenses. Deferred revenue, 0.0% of revenue.

Debt schedule. Two tranches, and interest is calculated on the average of the beginning and ending balances. Average, both tranches, every year — not on the opening balance. That gets checked.

Term loan opens at 3.5 in FY2022A. Mandatory repayments of 0.5 a year starting in FY2022A, and they run until it's fully repaid. Rate is 0.0% in FY2022A and FY2023A — that's actually zero, it's not a missing input — then 10.0% from FY2024A onward for as long as there's a balance outstanding.

Line of credit opens at 1.5 in FY2022A. Repayments of 0.5 in FY2023A, 0.5 in FY2024A, 0.3 in FY2025B. After that, assume no further draws and no further repayments, so 0.2 stays outstanding all the way through FY2030P. 10.0% on it throughout, FY2022A to FY2030P, the whole period.

Then the bridge, FY2024A EBITDA to FY2025B EBITDA. This is the page the sponsor turns to first, ahead of the P&L, so it needs to be formula-driven the whole way. If I click into a step of that walk and find a typed number, we're doing it again.

Separate variance step for each of these: Segment Alpha revenue, Segment Beta revenue, Segment Gamma revenue, then everything else on the revenue side combined into a single line called "Other Revenue Lines" — use those words. Then COGS, Customer Acquisition, Postal Charges, Staff Costs, SG&A, and Other OpEx.

Columns are the component, the period-over-period change in value, the running cumulative EBITDA as you walk down, and the component type.

Under that, put in a helper block for the waterfall chart — Base, Increase, Decrease, Total — formula-driven as well, ready to plot. Somebody's going to want that chart in a deck this weekend and I don't want it built twice.

And close it out with three lines: starting EBITDA, total change, ending EBITDA.

Everything links — to the Assumptions sheet and to each other. Keep the color convention the book already uses: typed inputs one color, formulas another, cross-sheet links a third. And tie it out before it comes back to me. If the bridge doesn't foot to the P&L, I'm not the one who finds that out, the sponsor is.

2 – Cedarbrook Social IPO analysis

b68326d5 · in FIMR_N-1.xlsx · out FIMR.xlsx

I'm building out the IPO analysis for Cedarbrook Social and I need the pricing work done properly, because this goes in front of committee and they are not going to accept a single point estimate on anything.

The shell's in the FIMR file. Fees and commissions run at 1.1% — that's your rate everywhere fees come up.

Start in the option holder table. Calculate net shares using the treasury stock method, then total every column. Don't leave a column untotaled, they'll ask.

Then build the sections out.

Sources and uses of funds, shown in both dollars in millions and in shares. The source is the equity issued. The uses are primary shares — that's proceeds raised net of fees — primary shares underwriting fees, secondary shares again net of fees, and secondary shares underwriting fees. Put a check total row in. I want to see it foot on the page, not take it on faith.

Everything from the Balance Sheet through Pro Forma Ownership gets three columns: pre-money, IPO, post-money. The one exception is Valuation — that gets pre-money and post-money only, no IPO column.

Balance sheet, simplified. Pre-money cash and cash equivalents is 1,282, short-term investments 2,628. Goodwill 189. Operating assets are accounts receivable of 482, inventory 627, prepaid expenses 1,855, and other operating assets 121. On the other side, debt is 404 and capital leases 302. Operating liabilities are accounts payable 1,039, accrued expenses 144, and then deduct 302 of deferred tax asset offsets. Equity 5,597. The IPO column is the net primary proceeds landing in cash and in equity, and post-money is just the two columns added. Show total assets, and show total liabilities and equity.

Income statement, also simplified. Return on cash invested is 0%. Tax rate 40%. D&A 323, EBIT 1,756. Pre-money net interest income is negative 42 minus 19. Pre-money tax is negative 695. Net income attributable to participating securities is negative 332 in both pre-money and post-money. Pre-money EPS 0.4. The IPO column adds the return on the new cash at the assumed rate, and the tax effect of it. From there derive PBT, net income, net income attributable to Class A and Class B common stockholders, WASO, and EPS. And give me an EPS accretion-dilution line at the bottom.

Valuation, pre-money and post-money. Diluted NoSO, offer price — hardcode 38 in the post-money column — implied equity value, net debt, implied enterprise value, pre-deal P/E, post-deal P/E, and EV over EBITDA.

Pro forma ownership across pre-money, IPO and post-money. Pre-deal shareholders including the option holders, new shareholders, total shares, and the post-money ownership percentages.

Now the sensitivities, and this is the part committee actually reads.

Analysis at various prices. Offer price range from \$34.00 to \$42.00 in \$2.00 increments. For each price show pre-deal P/E, post-deal P/E and EV/EBITDA, driven off the valuation section — not retyped.

Shareholder dilution at different share issuance. Primary shares from 160 to 200 in increments of 10. Secondary shares from 211.2 to 281.2 in steps of 10. Run it against the pre-deal ownership percentage from the pro forma section.

New money raised. Offer prices \$34.00 to \$42.00 in \$2.00 increments across the top, primary shares 160 to 200 in increments of 10 down the side. Every cell calculates the new money raised.

Proceeds to existing shareholders. Same offer price range. Secondary shares 211.2 to 281.2 in steps of 10. Every cell calculates the proceeds to the existing holders.

On formatting — hardcoded inputs in blue, #0000FF. Calculated values in black. Arial 10 point. Number formats and header fills consistent with the surrounding model. This gets screenshotted straight into the committee memo, so it has to look like the rest of the book.

3 — Annual cashflows, four entities

bb849b91 · in 7.27_013_N-2.xlsx · out OUTPUT_WORKBOOK_-_TIBA.xlsx

The lender's credit team came back this morning and they won't work off the monthly tabs. They want annuals. So I need the annual cashflow statements built out for all four entities — TIBA, Stone Park, Sahary and El-Rowad — each on its own CF - Annually tab.

The good news is the tabs are already there with the right row structure and the section labels in place. What's missing is the numbers, and those come from aggregating each entity's monthly cashflow data into annual period columns.

For each tab, populate the annual period columns by summing the monthly data in eleven successive 12-month blocks starting October 2020. Eleven blocks of twelve — that covers the full 132-month monthly grid end to end, with nothing left over and nothing double-counted. Then complete the Starting Balance, Total and Grand Total columns consistently with the layout that's already there. Keep the row and section labels matching the corresponding monthly tab, because credit is going to read the two side by side and anything that doesn't line up becomes a question.

Complete every subtotal, total and net cashflow row using the workbook's standard cashflow section logic, and do it across all the column types, not just the annual ones.

Watch the finance sections, because the entities aren't the same. TIBA and Stone Park both have a Cashflow from Finance section — Facility Drawdown, Facility Repayment, Interest Expense and Other Fees — sourced off their monthly tabs. For those two, Periodical Net Cashflows is Net Cash Inflows and Outflows plus Net Cashflows from Finance. Sahary and El-Rowad have no finance section at all, so for those two Periodical Net Cashflows is just Net Cash Inflows and Outflows directly. Don't build a finance block where there isn't one.

Complete the cash balance roll-forward on each tab, and populate the Minimum Cash END Balance field at the top. That figure is the covenant conversation, so it needs to be right and it needs to be visible where they expect it.

Two hardcodes coming from the client side. On the Sahary CF - Annually tab, enter 0 for the Dues To Sister Companies line in the 2025 and 2026 annual columns. And on both the TIBA and the Sahary annual tabs, park a 60,000,000 memo figure in cell AU40 — that's outside the reporting columns, it's a memo, it shouldn't feed anything.

Formatting follows the monthly tabs. Blue for typed hardcodes, #008000 green for links to other tabs, black for same-sheet calculations.

4 – SBA acquisition model and loan tabs

ef94a62b · in 7.20_016_N-2.xlsx · out 7.20_016_N-1.xlsx

I'm building out a real estate acquisition model — SBA 504 and SBA 7(a) financing, plus a refinance in year 5. The sponsor's question is whether the LP gets paid, and I can't answer that until the debt is actually modelled. So I need the Assumptions tab wired up and three new monthly loan amortization tabs built: L1, L2 and L3.

Assumptions tab first, a few things to wire.

Add a year-number header row, 1 through 10, above the Gross Revenue row. That's the period index for the revenue and expense table, and you'll use it again later so don't skip it.

Then formulas for Total Expenses, which is Salaries and Wages plus Other Expenses; OPEX Expense Ratio, which is Total Expenses over Gross Revenue; and NOI. NOI has to respect the "Use Manual?" switch — if it's Yes, NOI is Gross Revenue times one minus the Manual Expense Ratio; if it's No, it's Gross Revenue less the actual Total Expenses. Both paths, driven off the switch.

SBA 504 Loan Amount is the SBA 504 percentage times RE Budget Total. SBA 7(a) Loan Amount is the SBA 7(a) percentage times the Basis for 7a Loan Calc, and that basis is Total Funds minus RE Budget Total.

For the REFI scenario, compute LTV Value by looking up NOI at the Refi Period year — use that year header row as the index — and dividing by the Cap Rate on Refi. Then REFI Amount is LTV times LTV Value. Look it up properly. The moment the sponsor asks what year 6 looks like instead of year 5, a hardcoded NOI falls over.

Alongside the General Assumptions block, add two sections.

Sources: SBA 504 Loan, SBA 7(a) Loan, Raised Funds, and Total. Pull the amounts from the loan amounts you just computed and from Required Raise.

Uses: Real Estate Purchase Price, Business Purchase Price, Acquisition Fee, Gap Funding, Loan Fees, Legal, Cash Reserve, and Total. Loan Fees and Legal are label only for now, no values — leave the rows in, we'll get numbers later. Cash Reserve is the residual, so that Sources Total equals Uses Total.

Below the deal terms section, add a Returns block — IRR and Equity Multiple for both LP and GP. And put a Remaining LP Balance After REFI label row in that same area. No value on it yet, that gets linked once the refi tab exists.

Now the three tabs. L1 is the SBA 504 amortization, L2 is the SBA 7(a), L3 is the REFI. All three follow the General Loan Amortization layout, and L3 additionally gets labeled REFI at the top so nobody mistakes it for a third original loan.

Parameter block at the top of each tab, pulling from the relevant Assumptions section: Loan Amount, Start Month of Repayment, I/O Period in months — that's the Assumptions years times 12 — End loan after I/O?, Recast Loan?, I/O Rate, Amortization Period in years, Term of Loan in years, Interest Rate, Payoff Early?, Start Date, End Date, and then summary totals for Total Interest and Total Principal Repaid.

Start Month of Repayment is hardcoded as 1 on L1 and on L2. On L3 you derive it from the REFI section on Assumptions — take the Refi Period and convert it to a month number.

Below the parameter block, build a 400-row monthly schedule on each tab. Monthly interest is the annual rate divided by 12. Use ROUNDUP when you're converting remaining amortization years into months.

Columns per row: Year number, Date, Model Month number, Borrow Amount, Beginning Balance, Principal, Balloon Payment, Exit Repayment, Extra Principal, Interest, Interest Rate, Ending Balance, Repayment Counter, Amortization Counter, Offset — that's when extra principal happens — Total Principal, Total Debt Payment, Amortization Payment not recast, Other Reduction to Principal, Total Principal again, Total Interest, and Amortization Only.

L1 is slightly different. It carries two additional period-tracking columns before Date, and it uses "Original Loan Month #" instead of "Model Month #". And on both L1 and L2, hardcode 0 in the Extra Principal input cells for the last four rows of the schedule — months 397 through 400.

Formatting. Hardcoded input values in blue, #0000FF. Same-sheet formula outputs in black. Cross-sheet formula links in green, #008000. Aptos Narrow size 11 throughout the new sections, with number formats and section header fills consistent with the rest of the workbook.

5 – Cedarbrook AUM and revenue forecast

fbe4760b · in Model_v4_N-2.xlsx · out Model_v4_N-1_v2_.xlsx

I'm building out the AUM and revenue forecast infrastructure for Cedarbrook. Management's forecast runs one blended fee rate across every product, and that is not going to survive diligence — open-ended funds and institutional accounts have never earned the same basis points. So we build the fee rate up from the actual history and forecast off that.

Three areas. Extend the AUM_Rollforward tab, create a Revenue_Build tab, create a Revenue_Forecast tab.

On AUM_Rollforward: the section (IV) Institutional Accounts is missing its Key Memo Item block after the Ending Balance. Add it — four rows, calculated off that section's own rollforward data: Inflows as a percent of BoP, Outflows percent of BoP, Market Performance percent of BoP, and Other percent of BoP.

Then add a (V) Total section that aggregates all four product categories, same structure as the individual sections — Beginning Balance, Inflows, Outflows, Net Flows, Market Performance, Other, Ending Balance — and give it a Key Memo Item block underneath with the same four percent-of-BoP metrics.

Revenue_Build is a new tab. It's a fee analysis schedule. Date header reading "Fiscal Year Ended," covering the fiscal year history we have. One section in the body, titled "(I) Fees by Avg AUM", with four sub-sections: (a) Open-Ended Funds, (b) Closed-End Funds, (c) Retail Separate Accounts, (d) Institutional Accounts.

Each sub-section is three rows. Fees — that's Investment Management Fees pulled from Revenue_Breakdown, in thousands. Avg AUM — the average of the beginning and ending AUM balances from AUM_Rollforward, in millions. And Avg Fees percent, which is the derived average fee rate. Only populate a column where you have both the beginning and the ending AUM. If you only have one end of it, leave the column empty — a half-year denominator flatters the fee rate and somebody will catch it.

Revenue_Forecast, also a new tab. Same "Fiscal Year Ended," date header, and a unit note reading "(AUM in \$mm, Revenue in \$'000s)". Four product sections mirroring the AUM_Rollforward categories: (I) Open-End Funds, (II) Closed-End Funds, (III) Retail Separate Accounts, (IV) Institutional Accounts.

Each section holds an AUM rollforward — BoP AUM, Net Flows, Market Performance, Other, EoP AUM. Then a driver memo block labeled with the product name and "AUM Drivers:" carrying Net Flows percent of BoP, Market Performance percent of BoP, and Other percent of BoP. Then an Avg Fees row. Then a revenue summary line labeled with the product name and "Revenue Inv. Mgmt Fees", driven off the period average AUM and the Avg Fees percent.

For the historical periods, source AUM from AUM_Rollforward, link Avg Fees from Revenue_Build, and compute the percent-of-BoP driver rows off the rollforward figures. FY2022 through FY2024 are the historical periods. FY2025 through FY2029 are forecast.

For the forecast periods, drive the AUM movements off BoP using a rolling three-year trailing average of each driver percentage. The window rolls forward, so once you're into the forecast it starts including prior forecast years — it isn't frozen on the last three actuals. Carry Avg Fees forward on that same rolling three-year basis.

Formatting: calculated values in black, Aptos Narrow size 11 in the sections you change, number formats consistent with the surrounding model, and section header fills consistent with the existing workbook style.
